

Dear Madams/ Sirs,

The MOTORIZED PULLEY Type:800H is related to a smooth and non-tilting conveyor, so it does not need a backstop mechanism.

The MOTORIZED PULLEY Type:630H is placed on the inclined belt and needs a backstop mechanism.

The length of the MOTORIZED PULLEY is 1400 and 1150 mm (the width of the corresponding belts are 1200 and 1000 mm, respectively).

As you can see in the attached picture, if the stacker beam is facing north; the direction of view of the conveyor belt (west to east) shown in the attached picture for the direction of rotation of the MOTORIZED PULLEY Type:630H is counterclockwise (ccw).

Therefore, if we change the direction of view from east to west, the direction of rotation will be clockwise (cw).

Also, if the stacker beam is facing south, the above directions will be reversed.

Therefore, it is necessary to explain to the manufacturer that this MOTORIZED PULLEY is as the drive PULLEY of the conveyor belt and is installed in the discharge part of the material of the belt (exit part of the belt).
